[Instructions to run the application](#): DO NOT MUTE the device while running this application.

The zipped folder submitted has the following files:

1. frontPage.html:

This is the main page where the application starts. This just has the tags defined. This page creates a form after dynamic drop downs are selected. The form takes in the information of the user and redirects the user to another page where he halts for 10 seconds and is redirected back to the front page.

I have used both cookies and local storage to check how each thing works.

As it's a music application, I also included music which starts playing as soon as the application runs. The music starts over when the application is refreshed. However it does not start over when the dropdowns are selected dynamically.

2. LastPage:

Redirecting page which redirects the user to the front page in 10 seconds. Music starts playing again when the page is redirected to the front page.

3. JavaScript.js:

Everything in the application happens through this script file.

4. UpgradePage:

This page has a slider which is defined in the JavaScript file.

5. Images file:

These images change with the every new drop down selection.

6. Style.m4a:

Song which runs through the application.
